# Dado Jig

The sides of the waterfall bookcase have dadoes in them for the bottom and four shelves. The jig you see here lets you rout both inside faces at the same time ensuring they match perfectly.

The length of this jig depends on the distance from the outer edge of your straight bit to the edge of the router plate at either end of the jig. Multiply that distance by two and add the length of the longest dado ( $28\frac{1}{2}$ ").

When routing the shorter dadoes, use a stop block like you see in the top drawing to establish the proper length at one end of the jig.
